WHAT IS CLAIMED IS:

1. A disposable wearing article for absorption of body fluids having a longitudinal direction, a transverse direction
5 and a thickness direction and comprising an inner sheet lying in the top in said thickness direction so as to face the wearer's body, an outer sheet lying in the bottom in said thickness direction and a body fluid absorbent first panel interposed between said inner and outer sheets and containing
10 water-absorbent fibers, said disposable wearing article further comprising:

said inner sheet formed by a liquid-pervious sheet or a liquid-impervious sheet and said outer sheet formed by a liquid-impervious sheet; and

15 said inner sheet and said first panel underlying said inner sheet lacking a part of a substantially central portion in said longitudinal direction as well as in said transverse direction as cut off so as to define a void, said void being filled with a second panel which is liquid-pervious hydrophobic
20 and have compressive elasticity in said thickness direction, a plurality of narrow strips extending parallel to one another in one of said longitudinal and transverse directions beyond said second panel and spaced apart from one another so as to

- 21 -

come in contact with a lower surface of said first panel, said narrow strips containing therein water-absorbent fibers compressed to a density higher than that of said water-absorbent fibers in said first panel and a hydrophobic liquid-pervious spacer member lying aside from said narrow strips toward said outer sheet and extending beyond said second panel in both said longitudinal direction and said transverse direction to space said first panel and parts of said narrow strips apart from said outer sheet toward said inner sheet.

10

2. The wearing article according to Claim 1, wherein said first panel comprises 100 to 10 wt% of the water-absorbent fiber and 0 to 90 wt% of super-absorbent polymer and said water-absorbent fiber in said first panel has a density of 0.04 to 0.10 g/cm³.

15

3. The wearing article according to Claim 1, wherein each of said narrow strips comprises 100 to 20 wt% of water-absorbent fiber, 0 to 80 wt% of super-absorbent polymer and 0 to 20 wt% of thermoplastic synthetic fiber and said water-absorbent fiber of said narrow strips has a density of 0.10 to 0.40 g/cm³ at least 0.03 g/cm³ higher than that of said water-absorbent fiber in said first panel.

20

4. The wearing article according to Claim 1, wherein said second panel comprises a first layer lying aside toward said inner sheet and a second layer lying aside toward said outer sheet both as viewed in said thickness direction, said first
5 layer being formed by a laminate of thermoplastic synthetic resin film and thermoplastic synthetic fiber placed on the inner side of said film and said second layer being formed by opened-cell polyurethane foam, said laminate forming a plurality of narrow strips extending adjacent to one another in one of said
10 longitudinal and transverse directions, and each of said narrow strips being formed on its upper surface with alternate crests and troughs repeated in a longitudinal direction of said narrow strip so that said crests in one of said narrow strips lie adjacent to said troughs in the other narrow strip adjacent to
15 said one of said narrow strips and said thermoplastic synthetic fibers are exposed on side surfaces of said crests.

5. The wearing article according to Claim 1, wherein said second panel comprises a porous liquid-pervious thermoplastic
20 synthetic resin sheet.
